## Sample Name:

Poly(styrene-b-ferrocenyldimethylsilane)

## Sample \#: P10353B-SFES

## Structure:

Composition:

| $\mathrm{Mn} \times 10^{3}$ <br> $\mathrm{~S}-\mathrm{b}-\mathrm{FES}$ | $\mathrm{Mw} / \mathrm{Mn}$ (PDI) |
| :---: | :---: |
| $52.0-\mathrm{b}-3.0$ | 1.15 |

## Synthesis Procedure:

Poly(styrene-b- ferrocenyldimethylsilane) is prepared by anionic living polymerization by successive addition of styrene followed by the addition of ferrocenyldimethylsilane monomer.

## Characterization:

An aliquot of the polystyrene block was terminated before addition of hexamethyl cyclotrisiloxane and analyzed by size exclusion chromatography (SEC) to obtain the molecular weight and polydispersity index (PDI). The final block copolymer composition was calculated from ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectroscopy by comparing the peak area of the styrene protons at $6.3-7.2 \mathrm{ppm}$ with the peak area of $\mathrm{Si}(\mathrm{CH} 3)$ at 0.2 ppm .

## Solubility:

Polymer is soluble in $\mathrm{THF}, \mathrm{CHCl}_{3}$, Toluene and precipitate out from ether and hexanes.
${ }^{1} \mathrm{H}$ NMR spectrum of the sample:
